

Test Report

FCC ID.: MTi160623E003

Date of issue: Jul. 12, 2016

Sample Description: PIN PAD

Model(s): G3

Applicant: Shenzhen Xinguodu Technology Co., Ltd.

Address: 17/A, Jinsong Building Tairan Industry And Trading

Garden, Shenzhen, China

Date of Test: Jun. 23, 2016 to Jul. 11, 2016

1. General description

1.1 Feature of equipment under test (EUT)

| Product name: | PIN PAD |
|----------------------|---|
| Model name: | G3 |
| Operating frequency: | 13.56MHz |
| Modulation type: | subcarrier load modulation |
| Power supply: | DC 5V from adapter |
| Adapter information: | Model: ADS-6MA-06 05050EPCU Input: 100-240V 50/60Hz Max. 0.3A Output: 5V 1A |
| Antenna designation: | Loop antenna (Antenna Gain: 0dBi) |

- Page 6 of 15 - Report No.: MTi160623E003

2. Test Configuration of EUT

2.1 EUT operation mode

During testing, the EUT is operated in a keeping TX mode.

2.2 Test conditions

During the measurement the environmental conditions were within the listed ranges:

- Temperature: 20°C~30°C - Humidity: 30%~70%

- Atmospheric pressure: 98kPa~101kPa

2.3 Testing site

| Test Site | Shenzhen Toby Technology Co., Ltd. |
|------------------------|--|
| Test Site Location | 1 A/F., Bldg.6, Yusheng Industrial Zone The National Road No.107 Xixiang Section 467, Shenzhen, Guangdong, China |
| FCC Registration No.: | 811562 |

2.5 Measurement uncertainty

Measurement Uncertainty for a Level of Confidence of 95 %, U=2xUc(y)

| RF frequency | 1 x 10-7 |
|----------------------------------|-----------|
| RF power, conducted | ± 1 dB |
| Conducted emission(150kHz~30MHz) | ± 2.5 dB |
| Radiated emission(30MHz~1GHz) | ± 4.2 dB |
| Radiated emission (above 1GHz) | ± 4.3 dB |
| Temperature | ±1 degree |
| Humidity | ± 5 % |

4. Test Result

4.1 Conducted emission

4.1.1 Limit

| Frequency | Limit | | | |
|-----------|------------|----------|--|--|
| (MHz) | Quasi-peak | Average | | |
| 0.15-0.5 | 66 to 56 | 56 50 46 | | |
| 0.5-5 | 56 | 46 | | |
| 5-30 | 60 | 50 | | |

Note: Decreases with the logarithm of the frequency from 0.15MHz to 0.5MHz.

4.1.2 Test method

- 1. The EUT was placed 0.8 meters from the horizontal ground plane with EUT being connected to the power mains through a line impedance stabilization network (LISN). All other support equipment powered from additional LISN(s). The LISN provide 50 Ohm/50uH of coupling impedance for the measuring instrument.
- 2. Interconnecting cables that hang closer than 40 cm to the ground plane shall be folded back and forth in the center forming a bundle 30 to 40 cm long.
- 3. I/O cables that are not connected to a peripheral shall be bundled in the center. The end of the cable may be terminated, if required, using the correct terminating impedance. The overall length shall not exceed 1 m.
- 4. LISN is at least 80 cm from nearest part of EUT chassis.
- 5. The resolution bandwidth of EMI test receiver is set at 9kHz.

4.2 Antenna requirement

4.2.1 Requirement defined in FCC 15.203

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited. This requirement does not apply to carrier current devices or to devices operated under the provisions of §15.211, §15.213, §15.217, §15.219, or §15.221. Further, this requirement does not apply to intentional radiators that must be professionally installed, such as perimeter protection systems and some field disturbance sensors, or to other intentional radiators which, in accordance with §15.31(d), must be measured at the installation site. However, the installer shall be responsible for ensuring that the proper antenna is employed so that the limits in this part are not exceeded.

4.2.2 EUT antenna description

The radio antenna of EUT is an internal permanently attached antenna, the maximum gain is 0dBi. So the antenna meets the requirement of this part.

4.3 20dB emission bandwidth

4.3.1 Test method

Set Spectrum Analyzer centre Frequency= Fundamental Frequency, RBW=10kHz, VBW= 10 kHz, Span= 200kHz

Allow the trace to stabilize, measure the maximum width of the emission that is constrained by the frequencies associated with the two outermost amplitude points (upper and lower frequencies) that are attenuated by 20 dB relative to the maximum level measured in the fundamental emission.

4.4 Radiated emission

4.4.1 Limit

The field strength of any emissions within the band 13.553-13.567 MHz shall not exceed 15,848 microvolts/meter at 30 meters.

Within the bands 13.410-13.553 MHz and 13.567-13.710 MHz, the field strength of any emissions shall not exceed 334 microvolts/meter at 30 meters.

Within the bands 13.110-13.410 MHz and 13.710-14.010 MHz the field strength of any emissions shall not exceed 106 microvolts/meter at 30 meters.

The field strength of any emissions appearing outside of the 13.110-14.010 MHz band shall not exceed the general radiated emission limits in §15.209, the field strength of emissions from intentional radiators shall not exceed the following:

| Frequency (MHz) | Field strength µV/m | Field strength dBµV/m | Detector | Measurement distance | |
|--------------------|---------------------------|-----------------------------|----------|----------------------|--|
| 1.705-30 | / | 69.54 | QP | | |
| 30-88 | 100 | 40 | QP | | |
| 88-216 | 150 | 43.5 | QP | | |
| 216-960 | 200 | 46 | QP | 3m | |
| 960-1000 | 500 | 46 | QP | | |
| Above 1000 | 500 | 54 | AV | | |
| Above 1000 | 5000 | 74 | PK | | |

Note: the measurement distance is 30m for 1.705MHz to 30MHz, 3m for above 30MHz.

4.4.2 Test method

The measuring distance of 3m shall be used for measurements at frequency up to 1GHz and above 1 GHz. The EUT was placed on a rotating 0.8m high above ground; the table was rotated 360 degrees to determine the position of the highest radiation.

For test frequency up to 30MHz, a loop antenna is used, the enter of the loop antenna is 1m above the ground.

For test frequency above 30MHz, he Test antenna shall vary between 1m and 4m, both Horizontal and Vertical polarization are set to make measurement.

For the actual test configuration, please see the test setup photo.

Remark:

- 1, Performed pretest to three orthogonal axes (x, y, z axis), the worst case emissions (X axis) were reported.
- 2, other frequency noises omitted in this report were not seen or had enough margin (more than 20dB).

4.5 Frequency stability

4.5.1 Limit

The frequency tolerance of the carrier signal shall be maintained within ±0.01% of the operating frequency over a temperature variation of -20 degrees to + 50 degrees C at normal supply voltage, and for a variation in the primary supply voltage from 85% to 115% of the rated supply voltage at a temperature of 20 degrees C. For battery operated equipment, the equipment tests shall be performed using a new battery.
